

Resist Tests

Sample Resist Sheets

February 2009 Issue of VSN

The following pages are scans of the sheets I used to test various potential resist mediums with various paints and inks. Please note that differences in computer monitors may cause colors and shades to be slightly off from their original.

These sheets won't make a lot of sense apart from the February 2009 VSN Resists article. They aren't neat and pretty sheets; rather they are a bit of a mess! They are working experiments and aren't meant to be art. Please see the article for a description of the specific mediums/brands used in these tests.

These test sheets also don't cover every possible brand or type of medium that might work for a resist. It's just a starting point that I hope will inspire you to try something similar with various materials in your craft room. Try your resist tests on a few types of paper, as that can make a big difference in the success or failure of some resists. Try different types and brands of inks and paints. Try different methods of application. Some resist mediums may work better if they are heat-set before paints or inks are applied over them. Some need to dry first. Experiment!
